Intensity Dependent Optics

Based on EPAC04 Paper: G. Arduini, F. Zimmermann, C. Carli

$$K_{eff} = \frac{eN_b}{2\sqrt{\pi}\sigma_z(E_b/e)} Im\{Z_{\perp,eff}\}$$

To 1st order, ΔK perturbation with intensity causes:

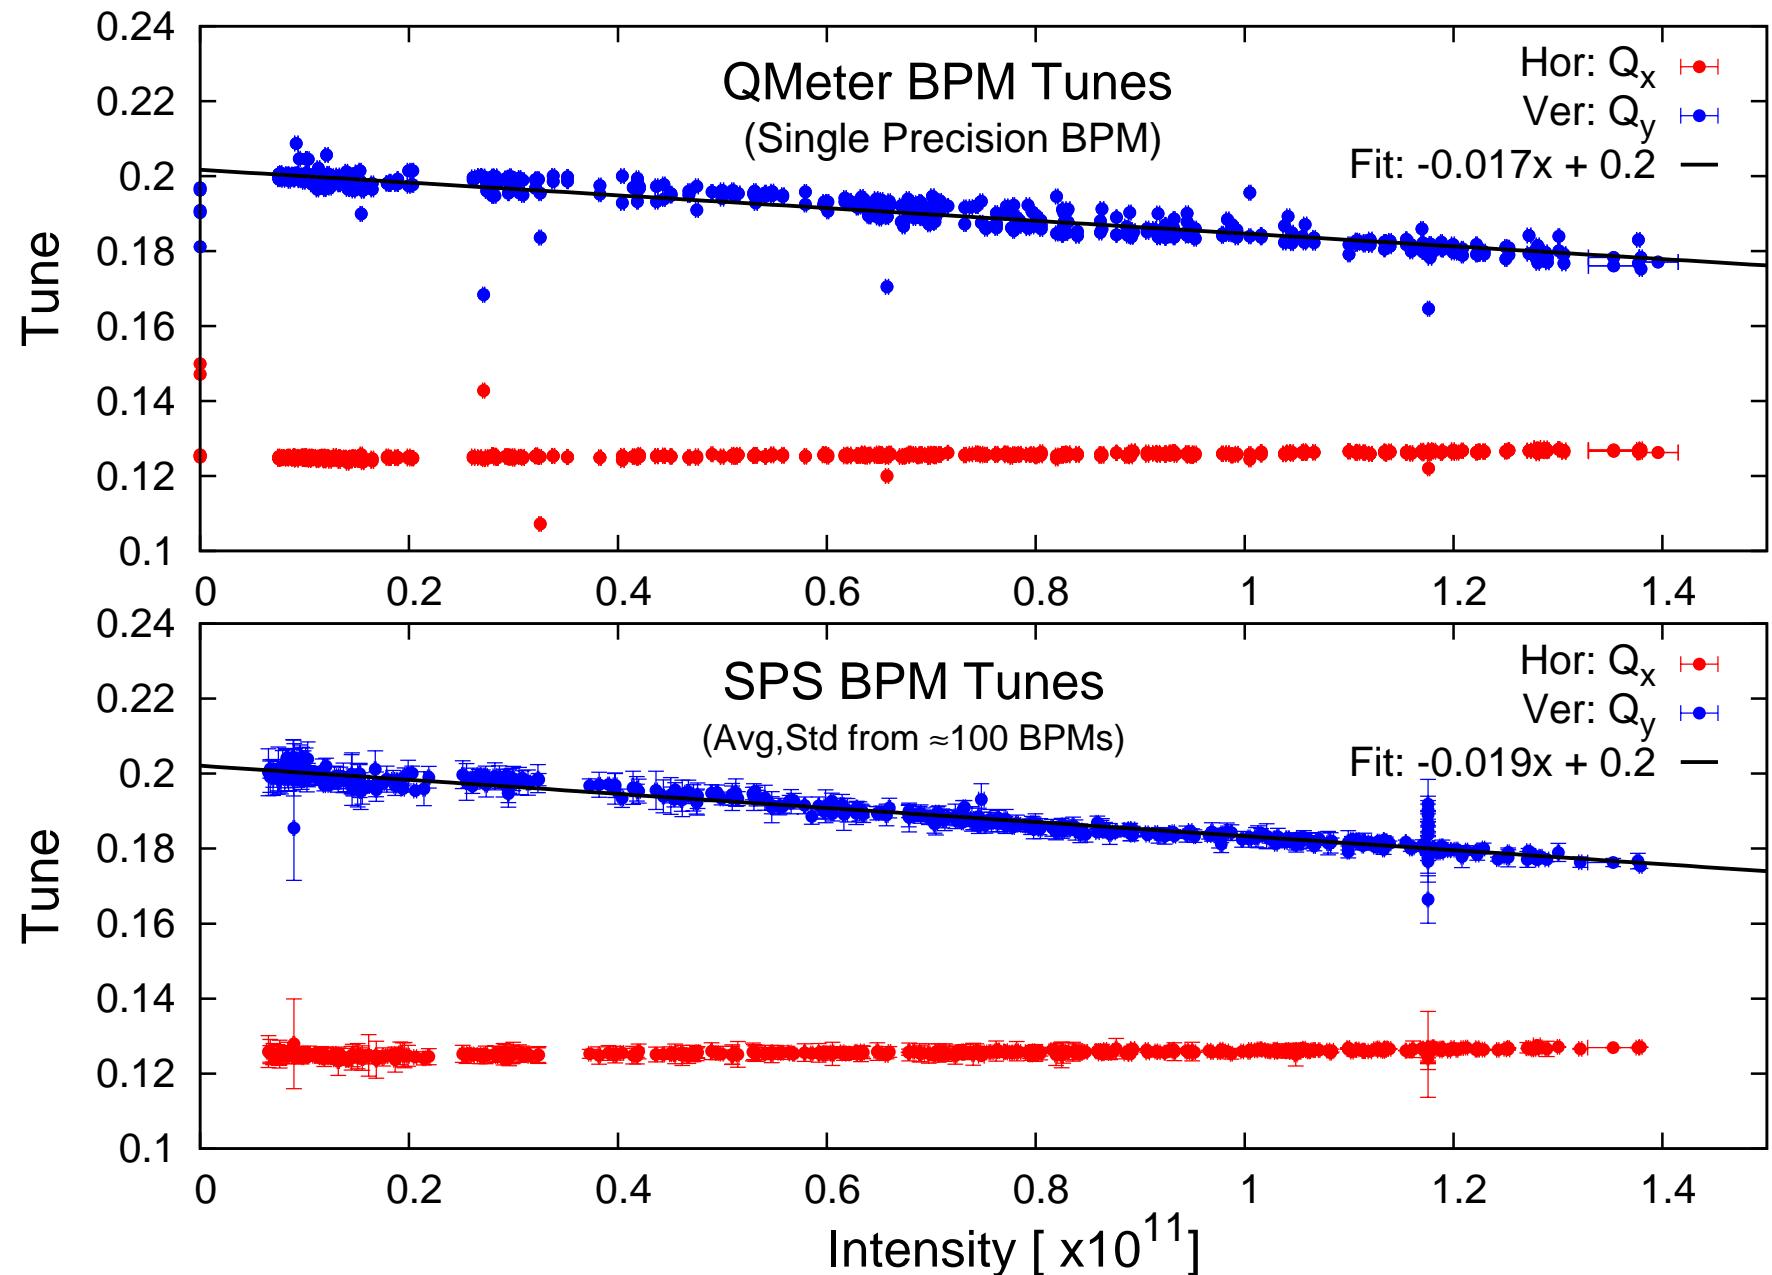

$$\Delta Q = \frac{1}{4\pi} \beta_k \Delta K$$

$$\frac{\Delta \beta(s)}{\beta(s)} = \frac{\beta_k \cos(2|\phi(s) - \phi_k| - 2\pi Q)}{2 \sin(2\pi Q)} \Delta K$$

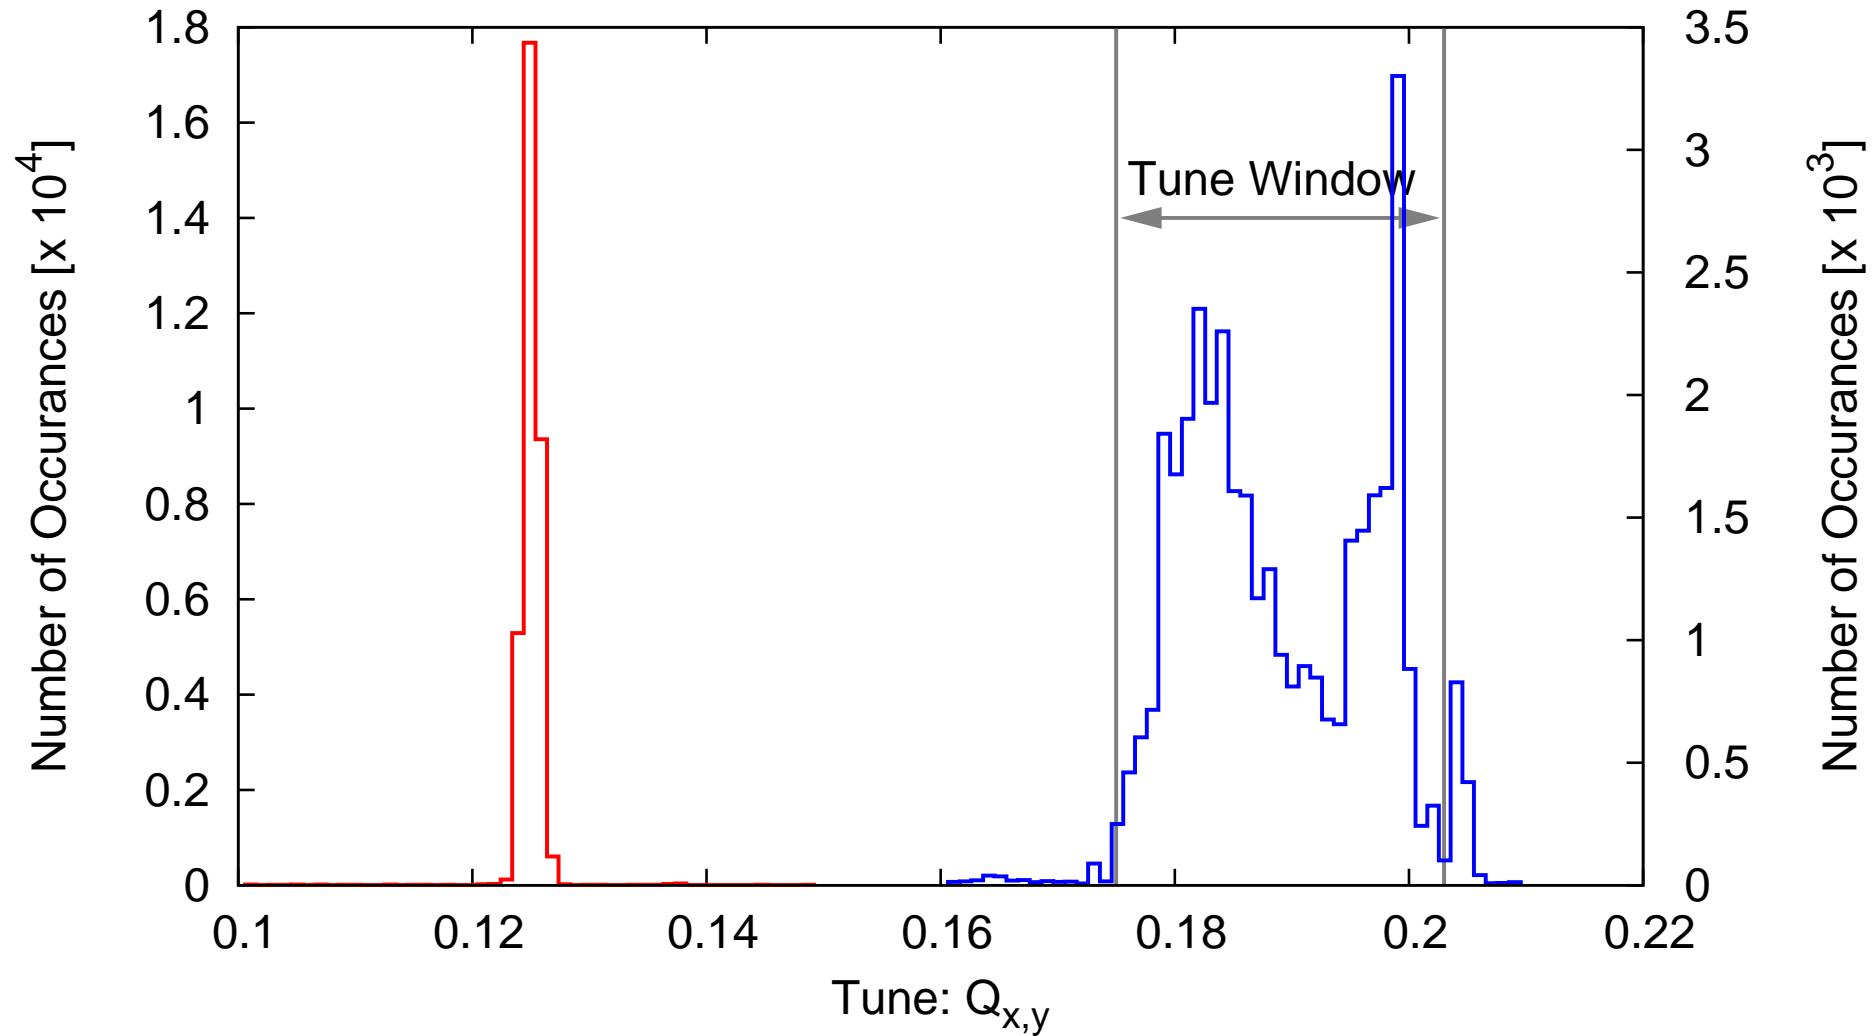

Procedure:

- Measure phase advance between BPM pairs for varying intensities
- Linear fit: $\phi_I = \phi_0 + (\Delta\phi/\Delta N_b)N_b$
- $\Delta K = R^{-1}\{\Delta\phi/\Delta N_b, Q_x, Q_y\}$, where R is model response matrix

Tune Vs. Intensity (Nov 2, 2007)

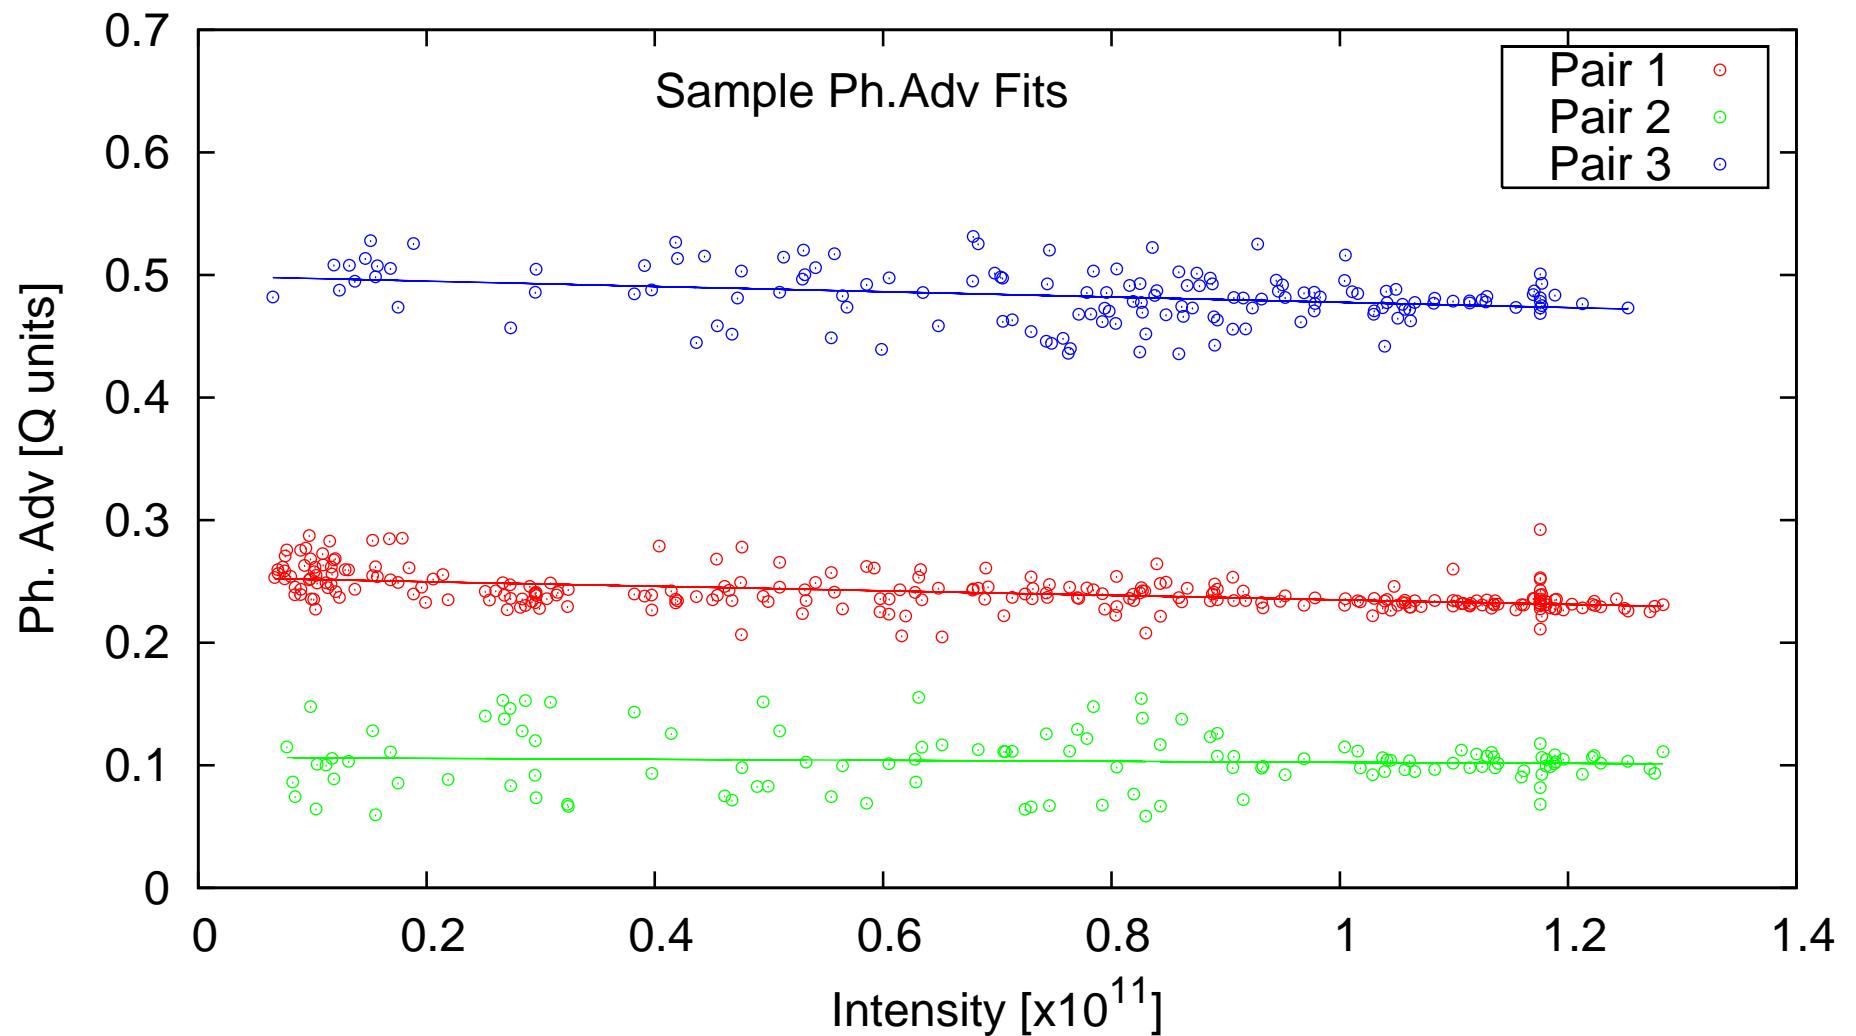

Data Selection

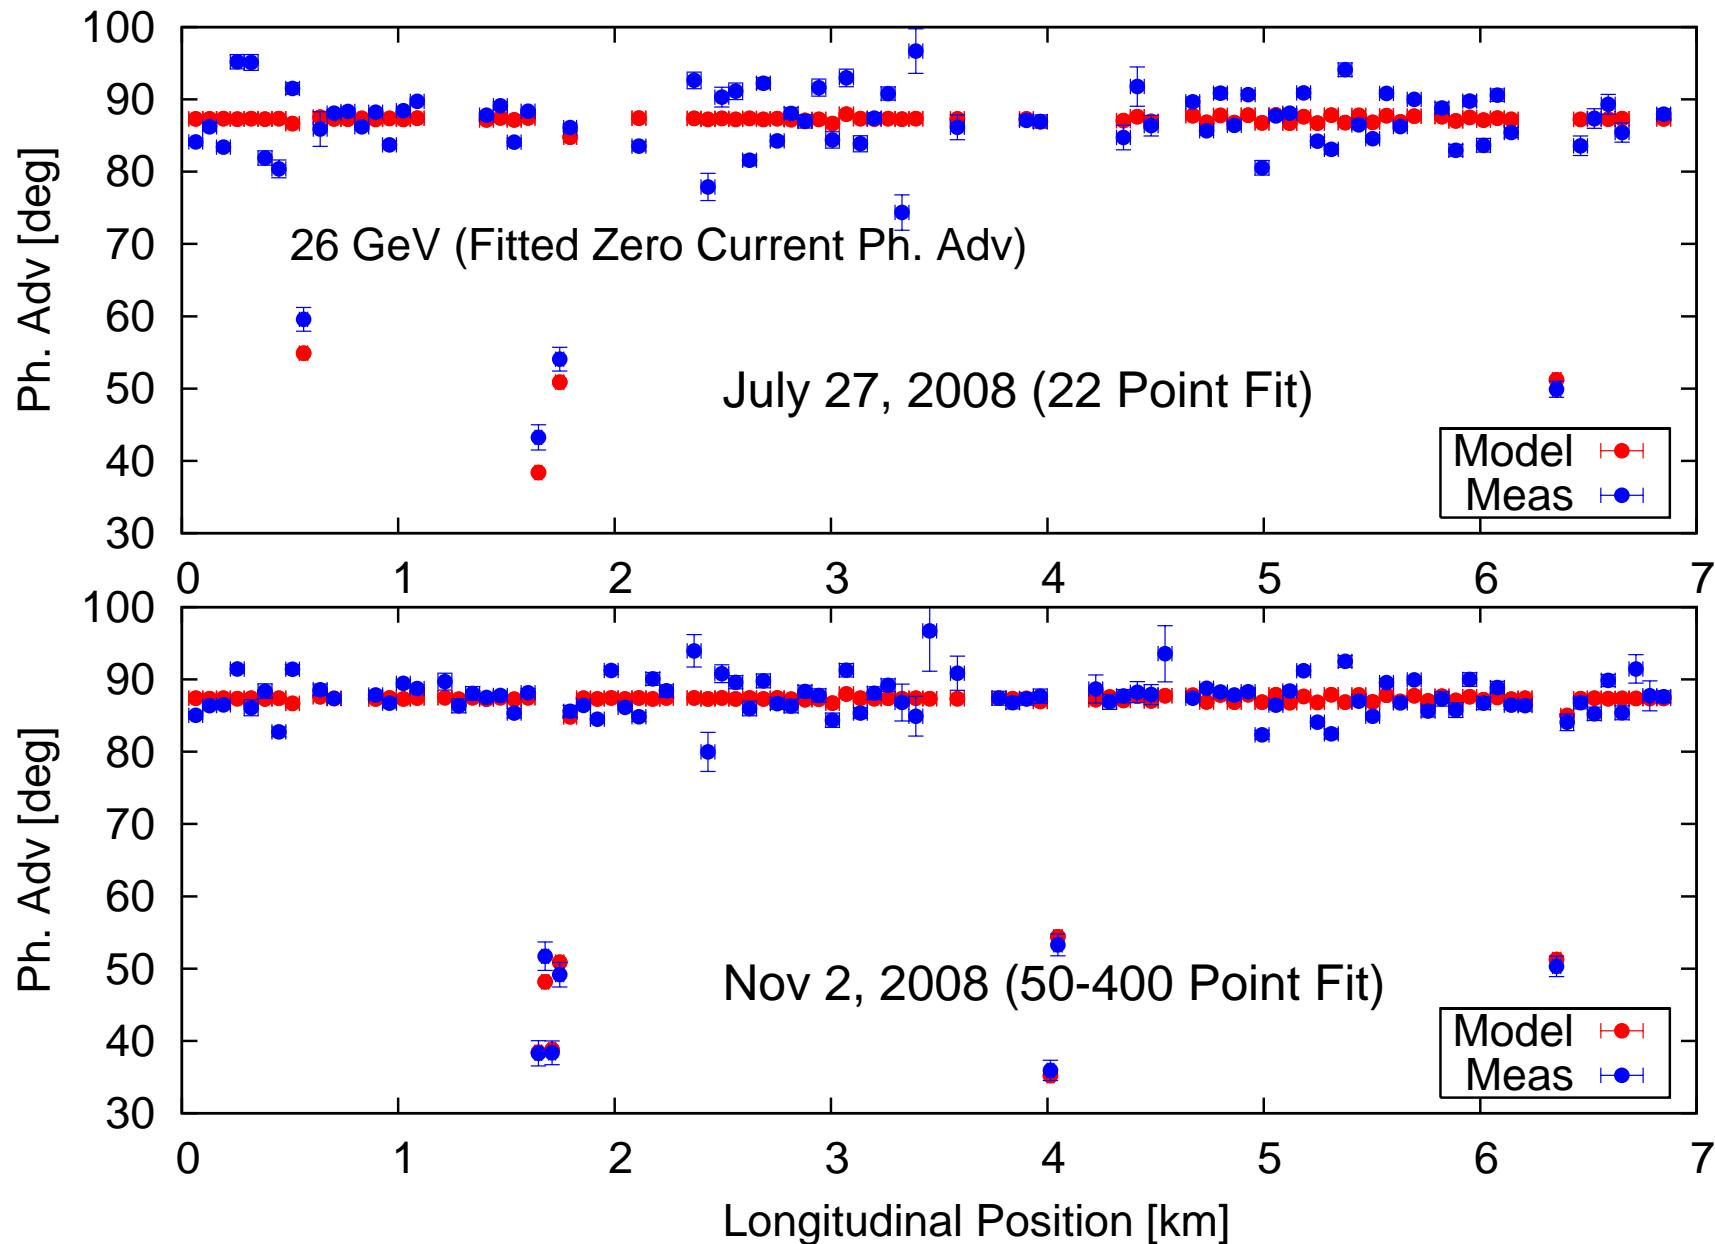

- Histogram of tunes from all BPMs (~ 100), all files (~ 410)
- Tune window & ph. adv of the (meas-model) used as selection criteria

Sample Fits (Nov 2 Data)

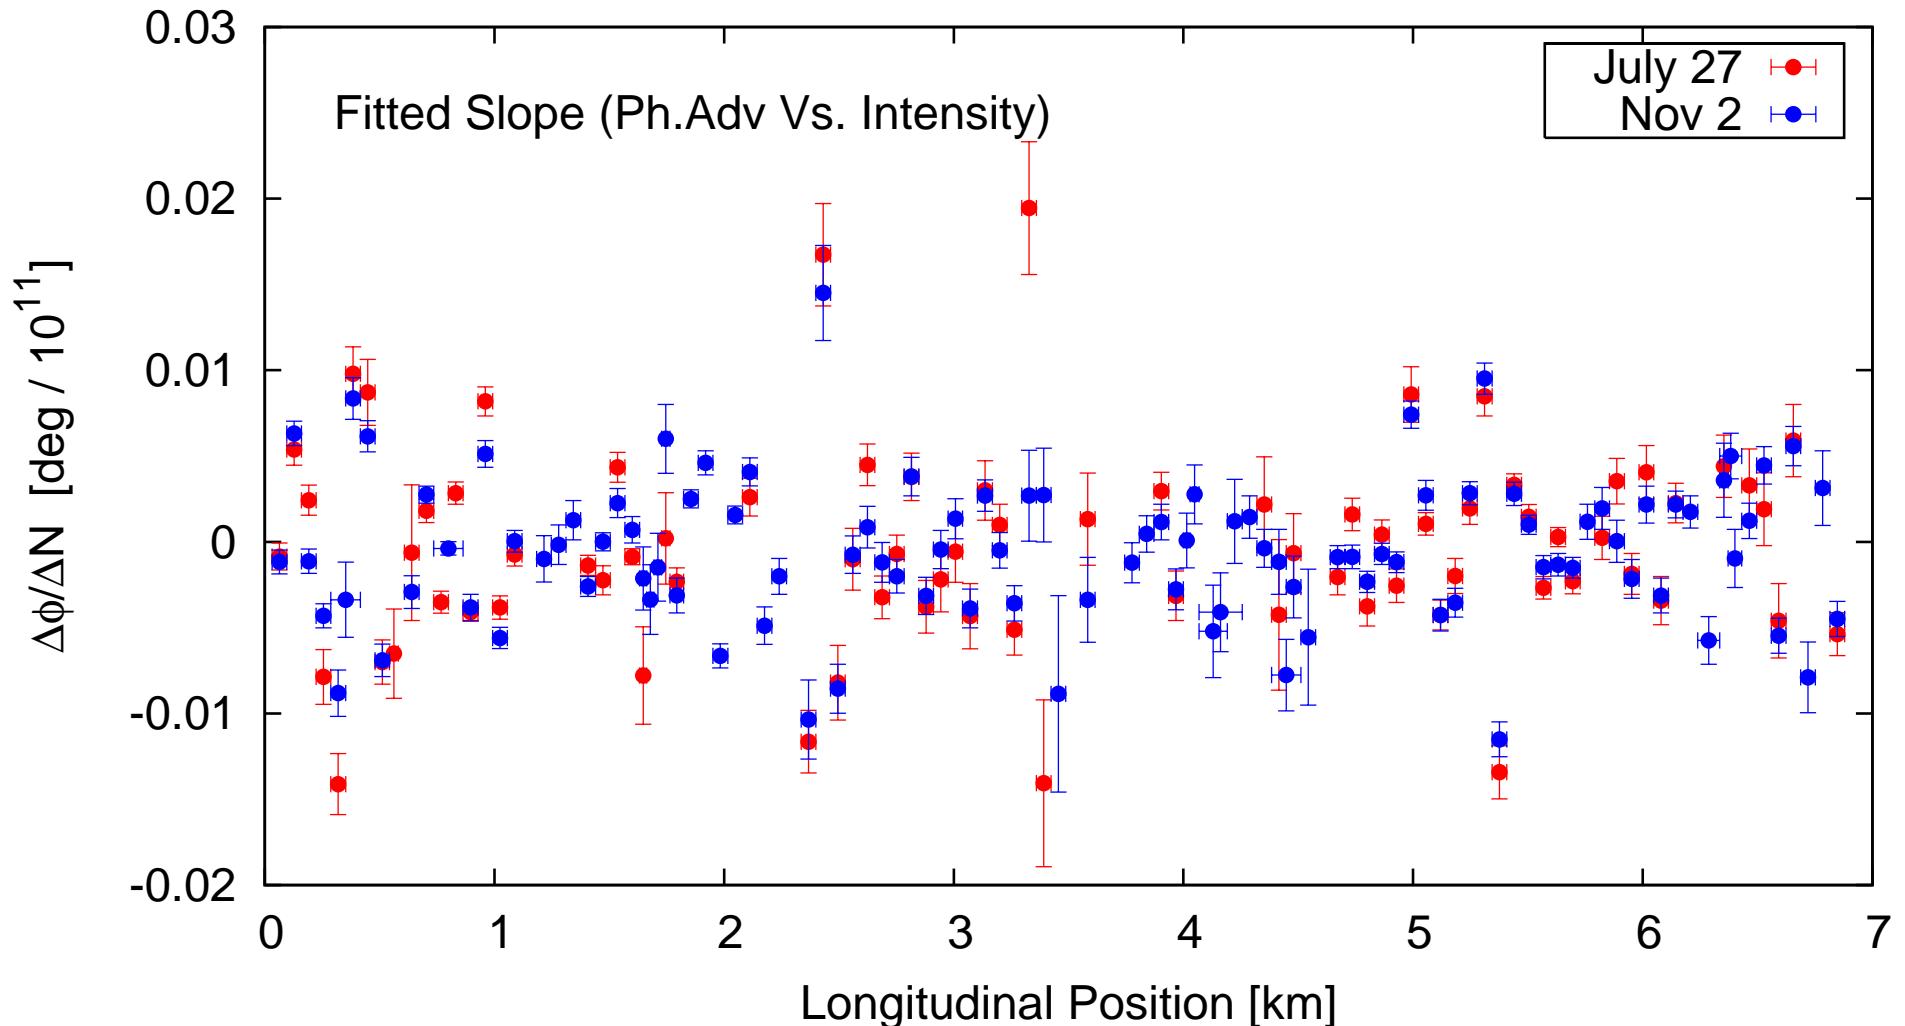

- Only fit BPMs passing selection criteria (lot of statistics)
- Spread is ph. adv is large (BPM gains ?)

SPS Zero Current Ph. Adv

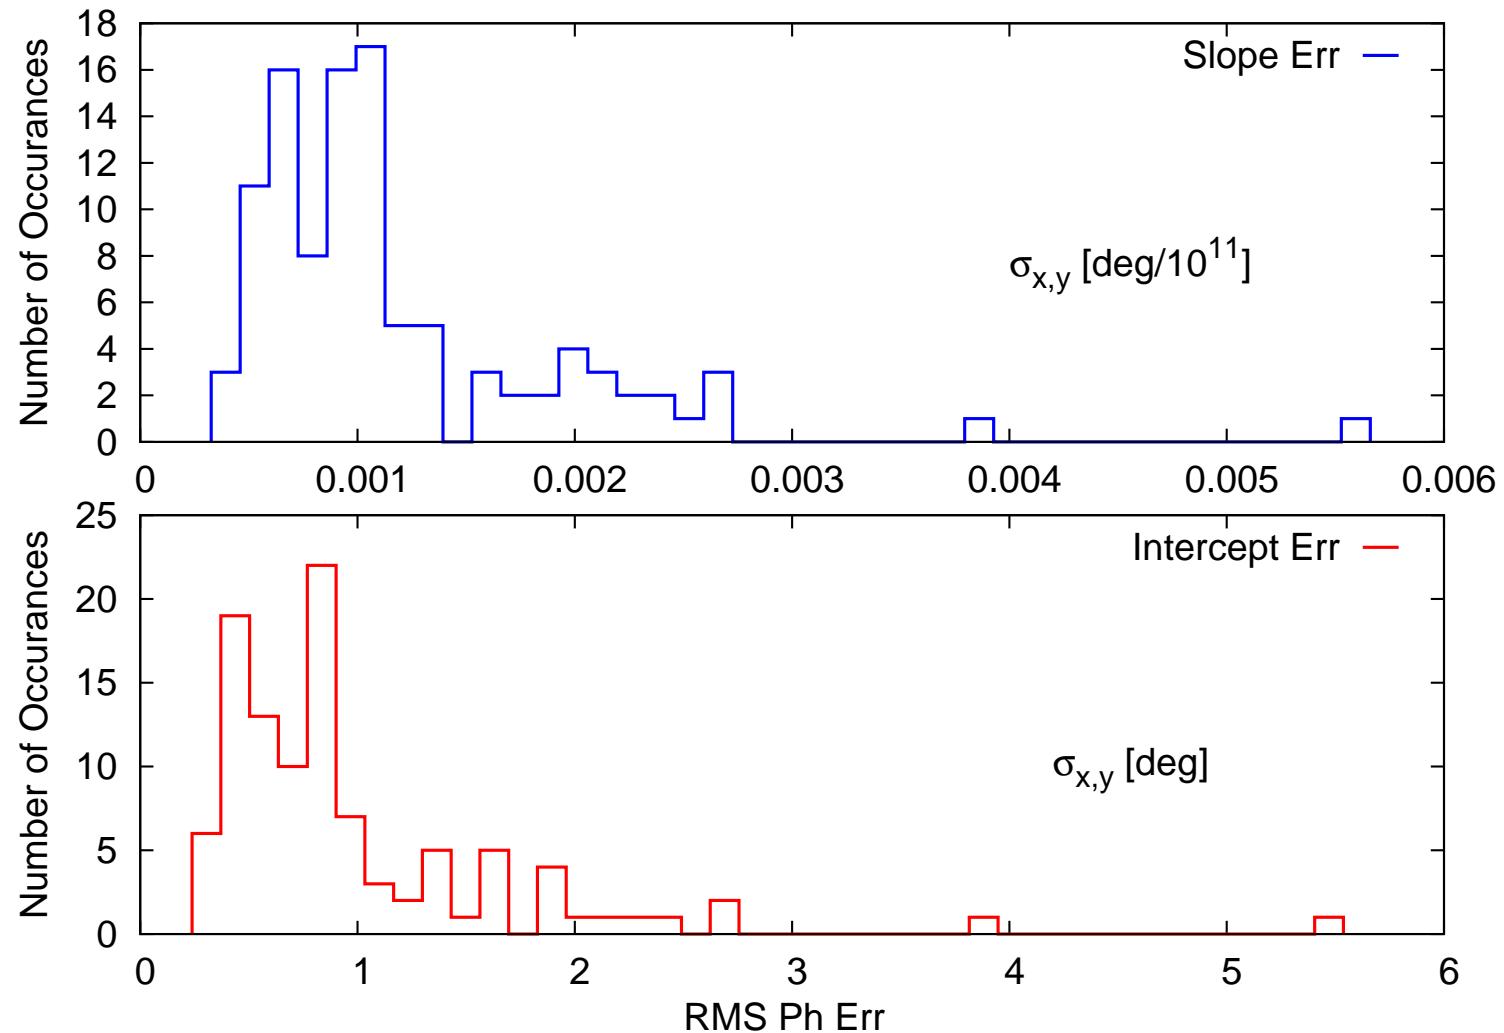

Fitted Slope $\Delta\phi/\Delta N$

- Similar slopes for 2 exps: Nov 2 (400 data sets) & July 27 (22 data sets)
- Relative error appears similar, not too much gain from statistics

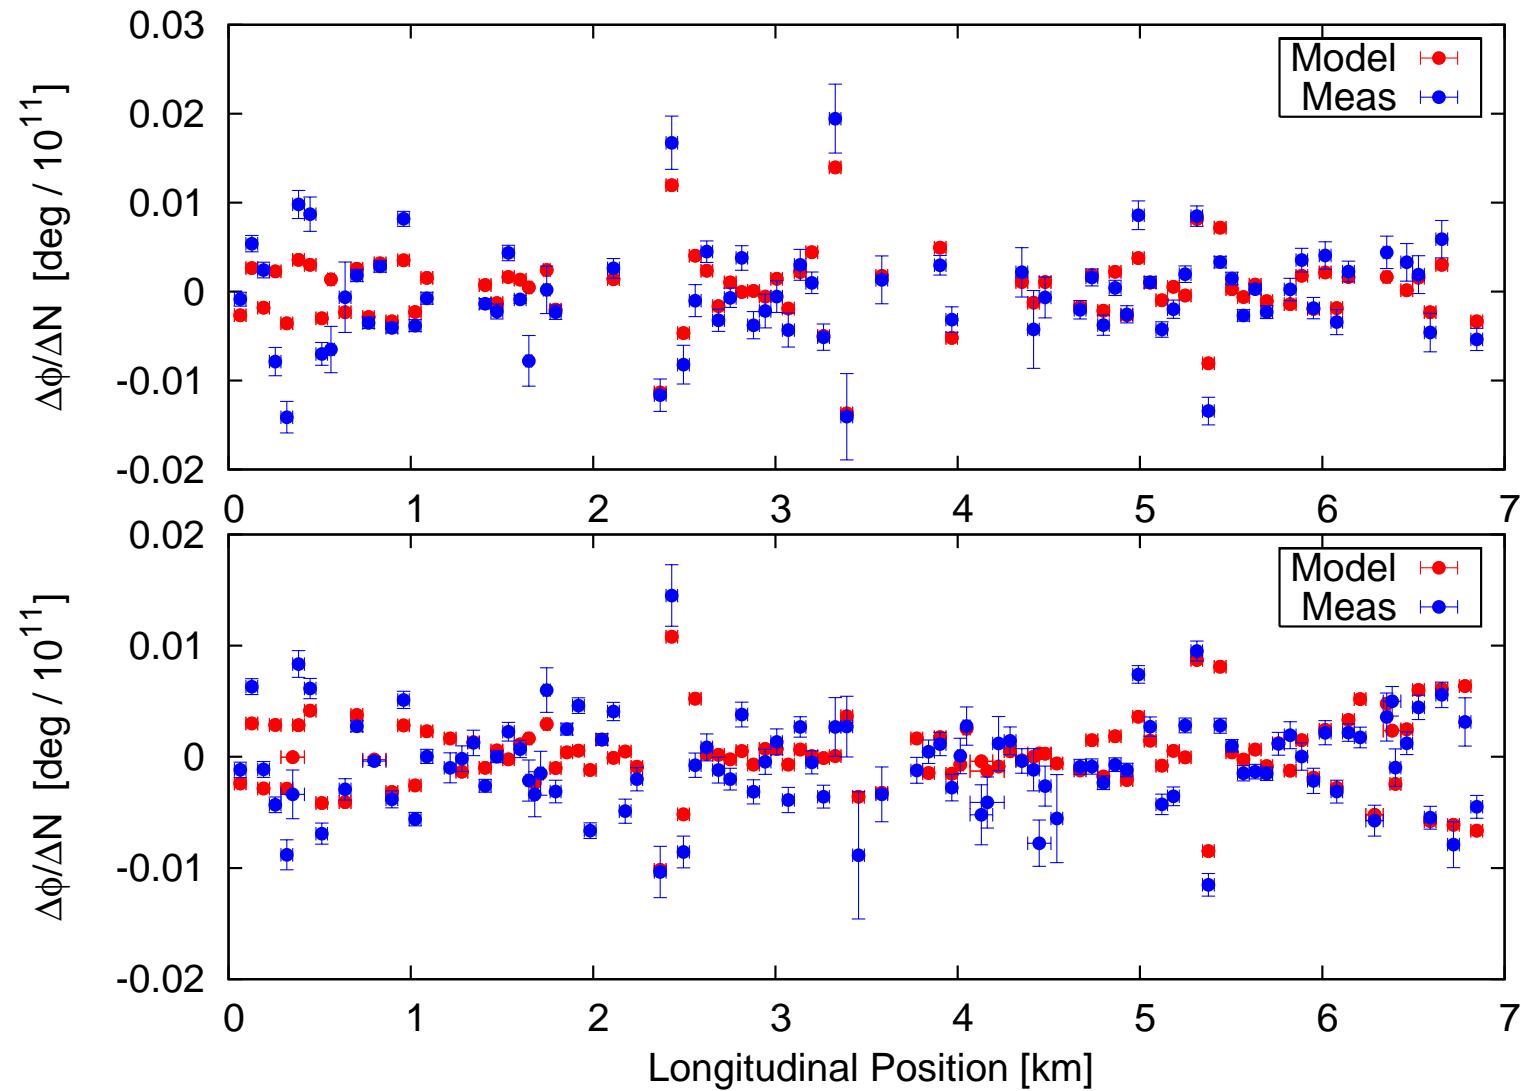

BPM Phase Err (Nov 2 Data)

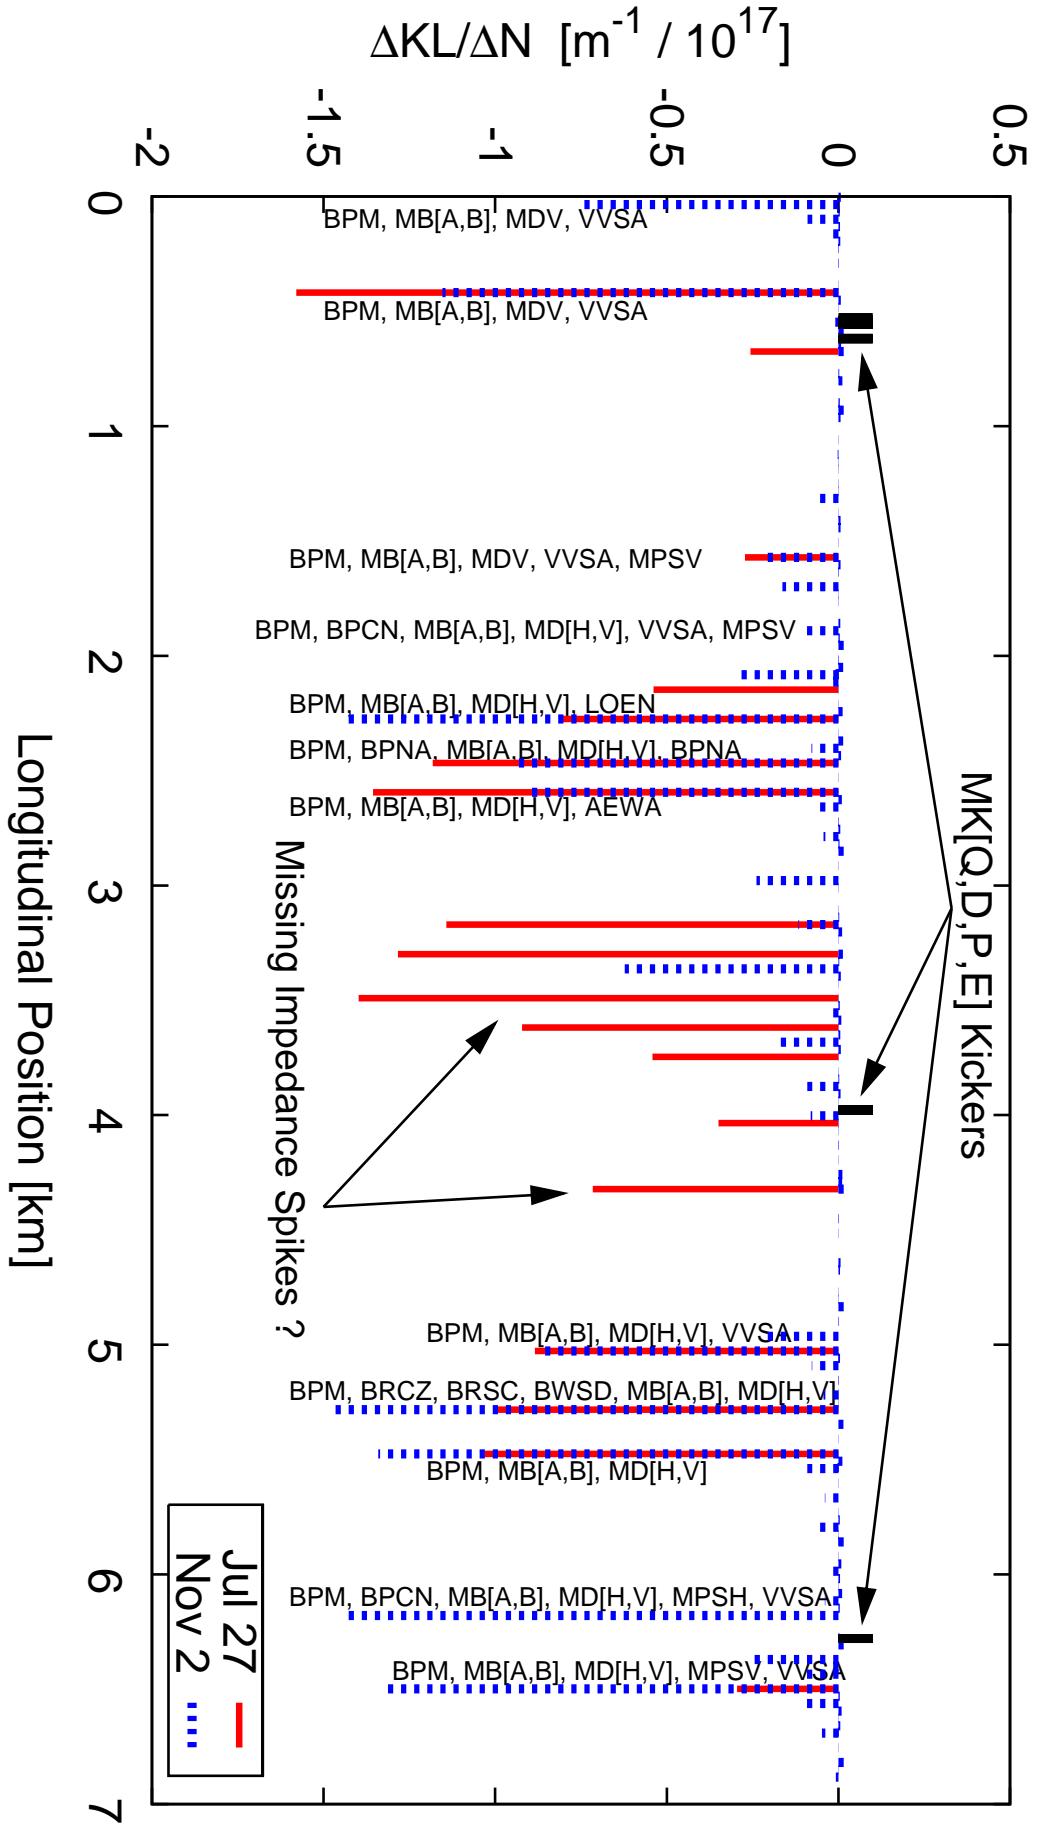

- Error in phase adv < 1deg (a bit high)
- Error in slope is 1 order of magnitude smaller than slope

Matched Model to Slope $\Delta\phi/\Delta N$

Constraint: $\Delta K < 0$ SVD (6 Iter) \rightarrow Simplex (18 Quads) \rightarrow SVD (6 Iter)

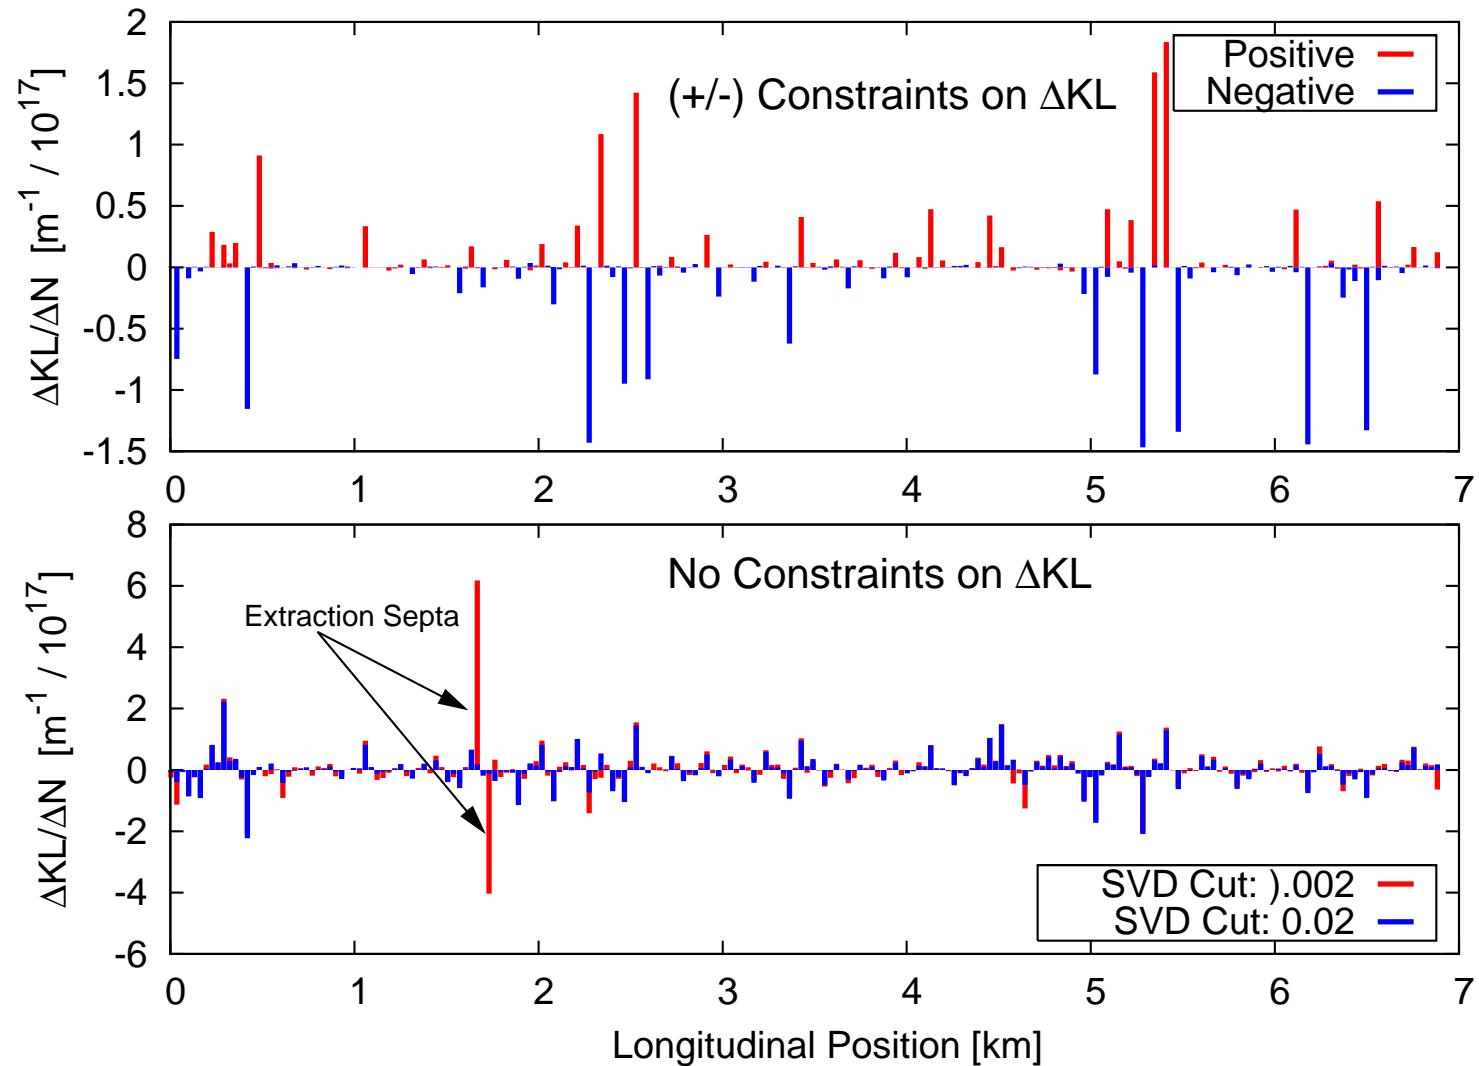

Estimated Impedance Distribution

- Sources near 2.5 km & 5.5 km ?? (Also seen by FZ/GA in 2004)
- Most sources similar for July 27 & Nov 2, some missing near 3-5 km

Estimated Impedance Distribution

- Main difference (\pm) constraints: 4-5 km, else remarkably similar
- No constraint yield big spike at 1.8 km & similar behavior with constraints
